AB The design and synthesis of the novel 2,3,4,5-tetrahydro-1H-[1,4]diazepino[1,7-a]indole (I) is described. This azepinoindole has excellent affinity for 5-HT2C (Ki 4.8 nM) and modest selectivity over 5-HT2A (.apprx.4-fold). Several N- and C11-substituted analogs of 5 were prepared, as were a number of biaryl indoline derivs. The anxiolytic potential for the azepinoindole template I is demonstrated by activity in a mouse shock-aggression assay.

AB Irradiation in 50% aqueous EtOH of the N-chloroacetyl derivs. of 7 isomeric indolyethylamines gave azepinoindoles and azocinoindoles through photocyclization at the ortho and peri positions. Quantum yields showed the relative reactivity at each position of the indole ring to be: 3 > 6, 4 > 7, 2 > 5 > 1. Frontier electron ds. of several indoles were calculated by CNDO/2 and INDO to establish reaction mechanisms and probable reactive species. The quantum yields for product formation from 1-substituted indoles correlated fairly well with the singly occupied mol. orbitals (SOMO) electron ds. (ED) of the 1-methylindole radical cation; there was a better correlation between quantum yields for product formation from 1-unsubstituted compds. and the SOMO-ED of the indole-1-radical. Thus, photocyclization of N-chloroacetylindolyethylamines involves both indole radical cations and indole-1-radicals as reactive intermediates.

AB (N-chloroacetyl aminoethyl)indoles, with the side chain at N, C-3, and C-4, underwent photochem. cyclization to give azepinoindoles and azocinoindoles. Thus, I gave II and III. The C-2, -5, -6, and -7 substituted analogs gave azepinoindoles. The mechanism for the photocyclization involved intramol. electron transfer from the excited singlet state of the aromatic chromophore to the chloroacetyl moiety via an exciplex, leading to cleavage of the C-Cl bond. The resultant methylene radical coupled with the aromatic radical cation to form the cyclization product. The reactivity of the position on the aromatic ring to which the methylene radical coupled corresponded to the odd electron. d. MO calcns. of frontier electron ds. of indole radicals were reported.

For example, 2,3,4,5-tetrahydro-1H-[1,4]diazepino[1,7-a]indole-HCl (II-HCl) was prepared in a multi-step synthesis starting from Et H malonate and 2-nitrophenylacetic acid and involving the cyclization of

the Et [1-(2-bromoethyl)-2,3-dihydro-1H-indol-2-yl]acetate intermediate to the tetrahydro-1H-[1,4]diazepino[1,7-a]indol-2(3H)-one. I are useful as 5-HT receptor antagonists for the treatment of a variety of central nervous system disorders (no data).

~~AB Irradiation in 50% aqueous EtOH of the N-chloroacetyl deriva. of 7 isomeric~~

~~indolyethylamines gave azepinoindoles and azocinoindoles through photocyclization at the ortho and peri positions. Quantum yields showed the relative reactivity at each position of the indole ring to be: 3 > 6, 4 > 7, 2 > 5 > 1. Frontier electron ds. of several indoles were calculated by~~

~~CNDO/2 and INDO to establish reaction mechanisms and probable reactive species. The quantum yields for product formation from 1-substituted indoles correlated fairly well with the singly occupied mol. orbitals (SOMO) electron ds. (ED) of the 1-methylindole radical cation; there was~~

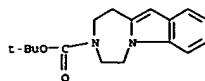

~~a better correlation between quantum yields for product formation from 1-unsubstituted compds. and the SOMO-ED of the indole-1-radical. Thus, photocyclization of N-chloroacetylindolyethylamines involves both indole radical cations and indole-1-radicals as reactive intermediates.~~

~~underwent photochem. cyclization to give azepinoindoles and azocinoindoles. Thus, I gave II and III. The C-2, -5, -6, and -7 substituted analogs gave azepinoindoles.
